Clinical Guideline
South Australian Perinatal Practice Guidelines – caesarean section

Policy developed by: SA Maternal & Neonatal Clinical Network
Approved SA Health Safety & Quality Strategic Governance Committee on:
10 June 2014
Next review due: 30 June 2017

Summary
Clinical practice guideline on caesarean section considerations

Keywords
caesarean section, lower uterine segment caesarean section, emergency LSCS, elective LSCS, CS, LSCS, antacid prophylaxis, categorisation of CS, Perinatal Practice Guidelines, clinical guideline

Policy history
Is this a new policy? N
Does this policy amend or update an existing policy? Y
Does this policy replace an existing policy? Y
If so, which policies?
Caesarean section

Applies to
All SA Health Portfolio
All Department for Health and Ageing Divisions
All Health Networks
CALHN, SALHN, NALHN, CHSALHN, WCHN, SAAS
Other

Staff impact
N/A, All Staff, Management, Admin, Students, Volunteers
All Clinical, Medical, Nursing, Allied Health, Emergency, Dental, Mental Health, Pathology

Note

This guideline provides advice of a general nature. This statewide guideline has been prepared to promote and facilitate standardisation and consistency of practice, using a multidisciplinary approach. The guideline is based on a review of published evidence and expert opinion.

Information in this statewide guideline is current at the time of publication.

SA Health does not accept responsibility for the quality or accuracy of material on websites linked from this site and does not sponsor, approve or endorse materials on such links.

Health practitioners in the South Australian public health sector are expected to review specific details of each patient and professionally assess the applicability of the relevant guideline to that clinical situation.

If for good clinical reasons, a decision is made to depart from the guideline, the responsible clinician must document in the patient’s medical record, the decision made, by whom, and detailed reasons for the departure from the guideline.

This statewide guideline does not address all the elements of clinical practice and assumes that the individual clinicians are responsible for discussing care with consumers in an environment that is culturally appropriate and which enables respectful confidential discussion. This includes:

• The use of interpreter services where necessary,
• Advising consumers of their choice and ensuring informed consent is obtained,
• Providing care within scope of practice, meeting all legislative requirements and maintaining standards of professional conduct, and
• Documenting all care in accordance with mandatory and local requirements

Definition

> Caesarean section is the delivery of a baby through an incision into the abdominal wall and uterus

Incidence

> Caesarean section accounted for 32 % of births in South Australia in 2010
> Elective caesarean accounted for 15.5 % of births in South Australia in 2010 In 2010, caesarean sections in South Australia were primarily performed for:
  > Lack of progress (‘failure to progress’) or cephalopelvic disproportion (28 %)
  > Previous caesarean section (38 %)
  > Fetal distress (15 %)
  > Malpresentation (12 %)
> In 2010, elective caesareans in South Australia were primarily performed for:
  > Previous caesarean section (67 %)
  > Malpresentation (14 %)
  > Multiple pregnancy (3 %)

Antenatal preparation

Obstetric review

> Women who present with a history of previous caesarean section require referral and counselling appropriate to their individual needs. For further information follow link to Birth options after caesarean section

Education

> Studies have identified the following reasons why women request an elective caesarean section:
  > Anxiety related to a previous birth experience
  > Perceived safety
  > Psychological trauma

> Sexual abuse
> Pregnancy complications

> Approximately one in three women will choose a repeat elective caesarean section in preference to vaginal birth after a previous caesarean section.
> Some surveys have shown that women want more information about caesarean section and other obstetric interventions. Women should receive all information necessary to make an informed choice.
> It is important that the woman receives evidence-based information that is consistent across medical and midwifery clinicians.
> Explain the indications / risks associated with caesarean section relevant to the woman’s individual needs.

**Anaesthetic consult / review**
> Should be arranged for all women who are planning an elective caesarean section.
> It is preferable for the majority of caesareans to be performed under regional analgesia (spinal for elective caesarean section) as there is less maternal morbidity than with general anaesthesia.

**Caesarean section considerations**
> Elective caesarean sections should be planned to occur after 38 completed weeks unless there are medical indications requiring earlier intervention, because of an approximately 7% risk of neonatal respiratory complications before 39 weeks.
> Antenatal betamethasone (intramuscular 11.4 mg x 2 doses 24 hours apart) for elective caesarean section after 37 weeks and up to 39 weeks results in reduced admissions of the newborn to special care baby units with respiratory distress.
> Non-particulate antacid prophylaxis (sodium citrate 30 mL administered orally) should be given immediately before transfer to theatre. Mylanta and Gaviscon should not be given.
> Alternatively, Ranitidine 150 mg may be administered orally if more than 2 hours pre caesarean section or Ranitidine 50 mg may be administered by slow intravenous injection (diluted in 20 mL of sodium chloride 0.9% and given over 5 minutes).
> A group and save should be taken before transfer to theatre and on-site cross matching facilities should be available.
> Intravenous access.
> Thromboprophylaxis according to the established risk factors for venous thromboembolism.
> Mechanical devices e.g. graduated compression stockings or intermittent compression devices (calf compressors) may be used.
> Single dose prophylactic antibiotic cover should be administered to all women during their caesarean section. First or second generation cephalosporins are recommended.
> A Surgical Team Safety Checklist should be performed as per SA Health Policy Directive, please refer to “Surgical Team Safety Checklist”.

**Categorisation of urgency for emergency caesarean section**
> Categorisation of emergency caesarean section facilitates communication and reduces misunderstanding between health care professionals. The risk level of the woman and the timing of decision making by medical practitioners (general practitioners or specialists) in Level 3-4 hospitals should be taken into account when determining the place for delivery.
> South Australian standards have been developed for the management of Category One caesarean section. There are four different emergency caesarean section categories to assist with the prioritisation of theatre cases and utilisation of theatre according to clinical urgency for delivery.
1. Category one – Immediate threat to life of patient or fetus e.g.:
   - Cord prolapse
   - Failed instrumental birth with fetal compromise (Bradycardia, high lactate or low pH i.e. < 7.2)
   - Maternal cardiac arrest
   - Abnormal fetal scalp blood sample / pH (high lactate or pH < 7.2)
   - Confirmed fetal blood (Apt's test) indicating ruptured fetal blood vessel, including vasa praevia
   - Sustained fetal bradycardia (< 70/min for ≥ 3 minutes)
   - Placental abruption
   - Placenta praevia with major haemorrhage
   - Identified irreversible abnormality on the cardiotocograph that requires delivery within 30 minutes

2. Category two – Maternal or fetal compromise but not immediately life threatening e.g.
   - Identified, but irreversible abnormality on the cardiotocograph but safe to deliver within 60 minutes
   - Malpresentation of the fetus

3. Category three – Needing early birth but no maternal or fetal compromise
   - Failure to progress in labour
   - Malpresentation in early labour
   - Planned caesarean section presenting in labour
   - Maternal condition requiring stabilisation, e.g. preeclampsia

4. Category four – At a time to suit the woman and the caesarean section team

- The booking to birth interval for level 5 and 6 hospitals is audited in accordance with a designated IT software system named “Operating Rooms Information Management System (ORMIS)”. Level 3 and 4 hospitals will have a designated local documentation procedure which may be electronic or paper-based.

- A RCOG (2004) review of decision to delivery times found maternal and neonatal outcomes do not change for decision to delivery intervals of up to 75 minutes. However, delays to delivery of > 75 minutes were associated with poorer outcomes; the effect greater with pre-existing maternal or fetal compromise.

- Once a decision to perform an emergency caesarean section has been made, it is recommended that fetal heart rate monitoring is done until the commencement of surgery.

### Tocolysis to assist with delivery

- Consider administering a uterine relaxant e.g. nitroglycerin 50 to 200 micrograms IV (further information is currently being developed).

### Third stage prophylaxis (oxytocin) during caesarean section

- For information regarding third stage oxytocic prophylaxis after caesarean birth follow link to [Oxytocin: prophylaxis for the third stage of labour and PPH management](#).

### Postpartum care

#### Low risk elective / emergency caesarean section

- Ensure adequate analgesia.
- Early removal of indwelling catheter (within 24 hours).
- Follow local guidelines for thromboprophylaxis.
- Encourage early mobilisation and hydration.
- Encourage deep breathing and coughing (physiotherapy review as indicated).
- Diet as desired.
- Observe for postoperative complications e.g. transient ileus, urinary or upper respiratory tract infection, deep venous thrombosis, wound infection.
- Offer opportunities to discuss the birth and impact on future pregnancies with the responsible caregiver.

### Pain protocol control

This section is currently being developed.
