South Australian Perinatal Practice Guideline

Third and fourth degree tear management

© Department for Health and Wellbeing, Government of South Australia. All rights reserved.

Note:
This guideline provides advice of a general nature. This statewide guideline has been prepared to promote and facilitate standardisation and consistency of practice, using a multidisciplinary approach. The guideline is based on a review of published evidence and expert opinion.

Information in this statewide guideline is current at the time of publication.
SA Health does not accept responsibility for the quality or accuracy of material on websites linked from this site and does not sponsor, approve or endorse materials on such links.
Health practitioners in the South Australian public health sector are expected to review specific details of each patient and professionally assess the applicability of the relevant guideline to that clinical situation.
If for good clinical reasons, a decision is made to depart from the guideline, the responsible clinician must document in the patient's medical record, the decision made, by whom, and detailed reasons for the departure from the guideline.
This statewide guideline does not address all the elements of clinical practice and assumes that the individual clinicians are responsible for discussing care with consumers in an environment that is culturally appropriate and which enables respectful confidential discussion. This includes:

- The use of interpreter services where necessary,
- Advising consumers of their choice and ensuring informed consent is obtained,
- Providing care within scope of practice, meeting all legislative requirements and maintaining standards of professional conduct, and
- Documenting all care in accordance with mandatory and local requirements

Explanation of the aboriginal artwork:
The aboriginal artwork used symbolises the connection to country and the circle shape shows the strong relationships amongst families and the aboriginal culture. The horse shoe shape design shown in front of the generic statement symbolises a woman and those enclosing a smaller horse shoe shape depicts a pregnant women. The smaller horse shoe shape in this instance represents the unborn child. The artwork shown before the specific statements within the document symbolises a footprint and demonstrates the need to move forward together in unison.

Australian Aboriginal Culture is the oldest living culture in the world yet Aboriginal people continue to experience the poorest health outcomes when compared to non-Aboriginal Australians. In South Australia, Aboriginal women are 2-5 times more likely to die in childbirth and their babies are 2-3 times more likely to be of low birth weight. The accumulative effects of stress, low socio economic status, exposure to violence, historical trauma, culturally unsafe and discriminatory health services and health systems are all major contributors to the disparities in Aboriginal maternal and birthing outcomes. Despite these unacceptable statistics the birth of an Aboriginal baby is a celebration of life and an important cultural event bringing family together in celebration, obligation and responsibility. The diversity between Aboriginal cultures, language and practices differ greatly and so it is imperative that perinatal services prepare to respectively manage Aboriginal protocol and provide a culturally positive health care experience for Aboriginal people to ensure the best maternal, neonatal and child health outcomes.

Purpose and Scope of PPG
This guideline provides clinicians with information on the management of third and fourth degree tears. It includes details on risk factors, diagnosis and classification, repair technique and postnatal care and follow-up.
Table I: Complications associated with 3rd and 4th degree tears

Based on the RCOG Clinical Governance Advice, Presenting information on Risk
Summary of Practice Recommendations

Careful inspection of the perineum, vulva and vagina following birth is essential.

Rectal examination prior to suturing is required when the woman has undergone episiotomy or if the tear extends to the anal verge to determine classification of tear.

Repair of 3b, 3c and fourth degree tears should be undertaken in theatre with adequate analgesia.

Consult a colorectal surgeon if a large fourth degree tear is diagnosed.

Antibiotic cover is required for all third and fourth degree tears.

Postnatal bladder management requires specific attention.

Postnatal follow-up needs to be individualised.

Recommendations for subsequent births is based on presence of symptoms and the woman’s preference.

Third and fourth degree tear management

Literature review

> Obstetric anal sphincter injury encompasses both third and fourth degree perineal tears and can occur with an intact perineum
> In South Australia in 2010, third and fourth degree tears occurred in 3.4 % (n=450) of vaginal births⁴
> Prospective studies using postpartum anal endoanal sonography suggest that almost one third of primiparous women may sustain occult anal sphincter injury following vaginal birth⁴,⁵,⁶
> Recent randomised controlled studies of external anal sphincter (EAS) repair have reported low incidences of anal incontinence symptoms (e.g. loss of control over flatus, faecal urgency and staining) with 60 – 80 % of women asymptomatic at 12 months⁵
> Damage to the innervation of the sphincter muscles and pelvic floor may be related to pudendal nerve damage⁴,⁷

Classification of tears

First Degree:
> Injury to the perineal skin only

Second Degree:
> Injury to the perineum extending into the perineal muscles but not the anal sphincter (either external [EAS] or internal anal sphincter[IAS])

Third degree:
> Injury to the perineum involving the anal sphincter complex:
  > 3a: Less than 50 % of EAS thickness torn
  > 3b: More than 50 % of EAS thickness torn
  > 3c: Both EAS and IAS torn⁴

Fourth Degree:
> Disruption of the anal sphincter complex (EAS and IAS) and anal epithelium⁵. Occasionally there can be an anal or rectal mucosa tear behind an intact sphincter. Rectal examination before repair is recommended⁸

Risk factors

> First vaginal birth
> Instrumental delivery
> Prolonged second stage
> Macrosomia > 4 kg
> Midline episiotomy
> Occipitoposterior position at delivery
> Induction of labour
> Epidural analgesia
> Shoulder dystocia
> Most of the above risk factors cannot readily be used to prevent or predict the occurrence of a third or fourth degree tear⁹
> Damage to the pudendal nerves is cumulative in successive vaginal births⁷,¹⁰,¹¹
Management of Repair

> All women should be examined following vaginal birth to assess the degree of vaginal, perineal or rectal injury
> All sphincter damage must be identified, documented and treated appropriately
> This includes:
  > partial sphincter tears
  > sphincter damage with an intact perineum
  > “buttonhole” rectal mucosa tears
> Accurate diagnosis will mean that these women will have the best chance of normal anal function in years to come

Diagnosis of third and fourth degree tear

All women delivering vaginally should have:
> Informed verbal consent explaining the need for thorough examination of the vagina, vulva and perineum and why a per rectum examination may be required
> Good exposure and good lighting
> Good analgesia
> Vulval and vaginal examination
> The normal pattern of peri-anal rugae confirmed
> Rectal examination for all episiotomies or if tear extending to anal verge
> Direct visualisation of sphincter with digit in rectum
> Palpation of sphincter with digit in rectum and pill rolling action with thumb on sphincter

Recommended method for repair

> Third and fourth degree repairs should be undertaken by an obstetrician or a registrar trained to repair third and fourth degree tears after discussion with a consultant
> 3a tears may be repaired in labour and delivery if there is adequate analgesia
> All 3 b and c and fourth degree tear repairs should be carried out in theatre with adequate regional anaesthesia to facilitate adequate analgesia, good visualisation and relaxation of sphincter muscles

Repair technique

> Perform a repeat detailed assessment of the degree of vaginal / perineal / rectal injury under anaesthesia
> Ends of EAS should be mobilised by sharp and blunt dissection to facilitate a tension free repair
> When repairing the EAS, use either monofilament sutures such as 2-0 polydioxanone (PDS or Maxon) (DON’T USE Vicryl)
> For repair of complete tear of the EAS, either an overlapping or end-to-end (approximation) method can be used. Overlapping repair is preferred by most Obstetric Consultants specialising in the management of anal sphincter injury and Colorectal Surgeons; however, there is no level I evidence to support this
> Where the IAS can be identified, it is advisable to repair separately with interrupted sutures. When repairing the IAS, use fine suture size such as 3-0 PDS® and 2-0 Vicryl® (associated with less irritation and discomfort)
> 3a tears can only be repaired using an end-to-end repair
> Bury surgical knots beneath the superficial perineal muscles by performing a standard perineal repair to prevent knot migration to the skin
> Perform a rectal examination on completion to ensure the repair is intact
> Document the procedure in case notes and arrange postpartum follow up
Third and fourth degree tear management

Recommended antibiotic cover
> Give single IV doses of both cephazolin 2 g and metronidazole 500 mg

Allergy to penicillin
> Single IV doses of clindamycin 450 mg, AND gentamicin 5 mg / kg

Role of colostomy
> There is no clear consensus amongst colorectal surgeons on who requires Colostomy and no reliable data to base a decision on
> A Colostomy is not required for management of 3a, 3b and straightforward 3c tears
> A Colostomy is usually indicated with large 4th degree tears, especially when the tear extends above the levator muscles, or where other risk factors for fistula exist
> Consult with a colorectal surgeon regarding the need for a colostomy

Postpartum Management

Bladder management
> On average, bladder sensation takes between 6 to 7 hours to return after a vaginal birth with regional anaesthesia12
> In cases of 3rd or 4th degree tear, severe perineal discomfort is known to cause urinary retention with a delay of up to 12 hours before bladder sensation returns13
> Urinary catheterisation should occur following 3rd and 4th degree repair in the immediate postpartum period to minimise urinary retention. The optimum time for catheterisation after birth is uncertain. Careful attention should be paid to voiding after removal of the catheter, particularly in the first six hours after catheter removal (see Bladder Management for Intrapartum and Postnatal Women PPG available at [www.sahealth.sa.gov.au/perinatal](http://www.sahealth.sa.gov.au/perinatal))

Antibiotics
> The use of broad-spectrum antibiotic cover is recommended after obstetric anal sphincter repair to reduce the incidence of postoperative infections and wound dehiscence6
> Commence oral Augmentin Duo Forte® (amoxicillin 875 mg and clavulanic acid 125 mg) 12 hourly with meals for 5 days
> If allergic to penicillin, use both
  > oral ciprofloxacin 500 mg 12 hourly for 5 days
  > plus
  > oral clindamycin 450 mg 8 hourly for 5 days

Breastfeeding: All these drugs are acceptable

Analgesia and other measures
> Use a multimodal approach to minimise the use of opioid medication, i.e. oxycodone and codeine containing analgesics, as they may cause constipation
> Administer oral paracetamol 1 g every 6 hours as required
> If there are no contra-indications, administer diclofenac (Voltaren®) 100 mg suppository per rectum at the end of the procedure while the patient is in the lithotomy position. Subsequent doses can be administered orally (i.e. 50 mg TDS), commencing no sooner than ten hours after administration of the intra-operative dose
> Ice packs and resting supine / prone for 10 - 20 minutes every 2 – 3 hours over the first week may decrease symptoms of pelvic floor fatigue (e.g. swelling, pain and perineal descent)
> Bulking agents and stool softeners (e.g. Fybogel® 1 sachet three times a day, Lactulose® 20 mL twice daily, and Coloxyl® 120 mg 1-2 noxte in addition as required) are recommended. Commence after 24 hours and continue for two weeks before weaning off. Educate the woman about the need for adequate fluid intake when using bulking agents
> In-patient referral to a continence health professional (e.g. continence nurse advisor /
Third and fourth degree tear management

Practitioner or physiotherapist) for advice about defecation techniques, pelvic floor care and ongoing support

Before discharge, the woman must be fully informed about the nature of her injury, associated risks (see Table 1) and benefits of follow-up

Follow-up (at 6 weeks)

A third or fourth degree tear is a significant peripartum event. Postpartum follow-up by a consultant with an interest in management of third and fourth degree tears and a continence health professional referral is required. If the woman is experiencing incontinence or pain at follow-up, a colorectal opinion and investigation (endoanal ultrasound) may be necessary

Establish the following:

- Control of bowel motions
- Control of flatus
- Faecal urgency
- Offensive vaginal discharge (this may suggest a fistula)
- Confirm urinary continence
- Assess pelvic floor muscles
- Assess ongoing perineal discomfort

The mode of subsequent delivery should be discussed in the context of current symptoms or findings of postpartum sonography

Recommendations about future pregnancies

- Women who are asymptomatic may consider a vaginal birth
- Advise the woman that there is no evidence to support the role of prophylactic episiotomy in subsequent pregnancies
- Recommend LSCS:
  - Symptomatic
  - Previous 4th degree tear
  - Delayed surgical correction of sphincter damage
  - Other risk factor for sphincter damage (e.g. big baby, occipito posterior position)
  - Woman’s request
- It is appropriate to warn women that the cumulative effect of ageing, menopause and progression of neuropathy on long term sphincter weakness by the fifth and sixth decade may result in the new onset of symptoms for which treatment is available5
