Note:
This guideline provides advice of a general nature. This statewide guideline has been prepared to promote and facilitate standardisation and consistency of practice, using a multidisciplinary approach. The guideline is based on a review of published evidence and expert opinion.

Information in this statewide guideline is current at the time of publication.

SA Health does not accept responsibility for the quality or accuracy of material on websites linked from this site and does not sponsor, approve or endorse materials on such links.

Health practitioners in the South Australian public health sector are expected to review specific details of each patient and professionally assess the applicability of the relevant guideline to that clinical situation.

If for good clinical reasons, a decision is made to depart from the guideline, the responsible clinician must document in the patient's medical record, the decision made, by whom, and detailed reasons for the departure from the guideline.

This statewide guideline does not address all the elements of clinical practice and assumes that the individual clinicians are responsible for discussing care with consumers in an environment that is culturally appropriate and which enables respectful confidential discussion. This includes:

- The use of interpreter services where necessary,
- Advising consumers of their choice and ensuring informed consent is obtained,
- Providing care within scope of practice, meeting all legislative requirements and maintaining standards of professional conduct, and
- Documenting all care in accordance with mandatory and local requirements

Synonyms
Folate

Dose and Indications

Folate supplementation in neonates born < 34 weeks gestation OR < 2000g not receiving fortified breast milk or preterm formula (e.g. in neonates receiving unfortified breast milk or term/modified term formula)

Oral
62.5 microgram daily

To be commenced when tolerating enteral feeds of 150mL/kg daily.

Continue until term corrected age OR until discharge if this is earlier.

Prevention or treatment of folic acid deficiency in chronic haemolytic conditions

125 microgram daily
Preparation and Administration

Oral
Disperse one quarter of a tablet (¼ of 500 micrograms = 125 micrograms) in 2mL of sterile water. The resulting mixture contains 62.5microgram/mL folic acid.

<table>
<thead>
<tr>
<th>Dose</th>
<th>62.5microg</th>
<th>125microg</th>
</tr>
</thead>
<tbody>
<tr>
<td>Volume</td>
<td>1mL</td>
<td>2mL</td>
</tr>
</tbody>
</table>

Use mixture immediately. Discard remaining mixture after use.

Note: Folic acid is not soluble in water at this volume, and therefore an even dispersion of folic acid cannot be guaranteed. The above instructions have been developed for practicality.

Adverse Effects

Rare
Gastro-intestinal disturbance

Practice Points

▷ Do not give alone for vitamin B12 deficiency states.
▷ Caution in patients with suspected but undiagnosed anaemia, since folic acid may obscure the diagnosis of pernicious, aplastic or normocytic anaemia by alleviating haematologic manifestations while allowing neurologic complications to progress.
▷ Folic acid may decrease phenytoin and phenobarbital levels, decreasing seizure control. Monitor serum phenytoin/phenobarbital levels and observe the patient for sub therapeutic or toxic affects if folic acid is added to or discontinued from the treatment regimen.
▷ In the absence of good evidence for the use of folic acid in chronic haemolytic conditions, the standard dose of 125microgram daily has been recommended based on safety and convenience.
