What is flu?
Influenza or ‘flu’ is a highly contagious infection caused by the influenza virus. The virus is spread when an infected person talks, coughs or sneezes small virus containing droplets into the air, where they may be breathed in by people nearby. Infection may also be spread by contact with hands, tissues and other infected articles.

Flu infection can cause serious illness and complications, especially in young children, pregnant women and the elderly. Infection can be more severe when people have other existing medical conditions, such as diabetes, breathing or heart problems. Flu infection causes hospital stays and deaths every year.

After the vaccination, it is still possible to get flu but it will usually be much milder.

Why have the flu vaccine?
The flu vaccine helps your body to develop immunity without you getting the flu. The flu vaccine contains several inactivated strains to protect against the most commonly circulating flu viruses each year.

You cannot get the flu from the flu vaccine because it does not contain any live flu virus.

Who should receive the flu vaccine?
The seasonal flu vaccine is recommended for anyone aged six months and over who wishes to reduce the likelihood of getting influenza.

It is especially important for people at increased risk of complications from flu.

People eligible for free vaccine include:
- anyone aged 65 years and over
- pregnant women in any trimester
- Aboriginal and Torres Strait Islander persons aged six months and over
- all children from 6 months to less than five years of age
- those with chronic medical conditions (check with your doctor or nurse)

How often should I receive the flu vaccine?
As the flu virus changes frequently, the vaccine must be given each year to offer the best protection.

Children under nine years of age and some people with a lowered immune system should have two doses of vaccine at least one month apart when getting flu vaccine for the first time.
**When should I be vaccinated?**

The best time to vaccinate is autumn, but flu vaccine can be given at any time during the flu season while vaccine is available. It usually takes up to two weeks for the flu vaccine to provide protection.

Talk to your doctor or immunisation nurse about the best time for you to have the vaccine.

**Are flu vaccines safe?**

Yes. The Therapeutic Goods Administration (TGA) evaluates all vaccines to ensure they are safe and effective. Vaccines available in Australia must be registered with the TGA.

**Where can I get vaccinated?**

Go to your doctor or immunisation clinic.

There may still be a consultation fee even though the vaccine is free for some people.

**Are there any side effects?**

Most side effects are minor, last a short time and resolve without any treatment. Generally, common reactions such as fever, headache and soreness at the injection site begin within a few hours and last for 1-2 days.

Some people may experience mild flu-like symptoms for up to 48 hours after vaccination, as the immune system starts to respond to the vaccine.

Remember, you cannot get the flu from the vaccine because it does not contain any live flu virus.

More serious reactions are rare. All unexpected side effects should be reported to your health professional or the Immunisation Section, SA Health.
