Policy

Policy Guideline

Colonoscopy Urgency Categorisation and Surveillance Timing Policy Guideline

Policy developed by: Operational Strategy, System Performance
Approved at Portfolio Executive on: 17 June 2014
Next review due: 30 September 2018

Summary
The Guideline provides advice on urgency categorisation and appropriate surveillance intervals for patients requiring a planned colonoscopy, in line with established best practice. The needs of both adult and child patients are addressed.

Keywords
Colonoscopy, Gastroenterology, Urgency Categorisation, Surveillance, Bowel Cancer, Waiting List, Policy Guideline

1. Objective

The Colonoscopy Urgency Categorisation and Surveillance Timing Policy Guideline provides advice to SA Health services and clinicians on urgency categorisation and appropriate surveillance intervals for patients requiring a planned colonoscopy. Through implementing consistent urgency categorisation practices across all SA Health services the Policy Guideline aims to contribute to both the timely treatment of individuals, and equitable prioritisation and access to procedures for all patients.

The Policy Guideline addresses the varying needs and service provision arrangements for adults and children requiring a planned colonoscopy. Section 4 of the Policy Guideline relates to adult patients and sets out detailed usual urgency categories and surveillance timing intervals based on National Health and Medical Research Council endorsed guidelines. Section 5 relates to the provision of colonoscopies to children and reflects the established clinical practices of the specialist state-wide paediatric service run by the Gastroenterology Unit of the Women’s and Children’s Hospital. Whilst there is variation in the indications for colonoscopy for adults and children, the appropriate clinical timeframe for a colonoscopy procedure is denoted by the urgency category assigned by the patients treating public hospital clinician. The urgency category timeframes are consistent for all patients, regardless of age, and are as follows:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category 1</td>
<td>Colonoscopy should be provided within 30 days</td>
</tr>
<tr>
<td>Category 2</td>
<td>Colonoscopy should be provided within 90 days</td>
</tr>
<tr>
<td>Category 3</td>
<td>Colonoscopy is required within 365 days</td>
</tr>
<tr>
<td>Category 4</td>
<td>Deferred patients, which includes surveillance patients who require a surveillance colonoscopy at a specified date in the future, and patients who require a colonoscopy but are not ‘ready for care’</td>
</tr>
</tbody>
</table>

Urgency categories are assigned by SA Health clinicians to indicate the clinically appropriate time within which a patient should receive a required procedure, taking into consideration the patient’s symptoms, medical history and risk factors.

Whilst it is anticipated that the usual urgency categories and surveillance timing set out for adult patients will be suitable in most circumstances, it is acknowledged that the criteria are not exhaustive and there will be exceptional cases where the appropriate urgency categorisation or surveillance interval will vary and a different approach will be clinically appropriate. In addition, as outlined in section 5 of the Policy Guideline, the provision of colonoscopy to children is highly individualised and appropriate urgency categorisation and treatment planning will be determined through medical review, with patients monitored closely on an ongoing basis. It remains the responsibility of treating SA Health clinicians to determine the most appropriate clinical treatment for individual patients.

New evidence regarding best practice use of colonoscopy is continually evolving, and as such, this Policy Guideline will be reviewed and updated every 2 years to ensure it remains current. The Policy Guideline may also be reviewed at other times if new information becomes available.
2. Scope

This Policy Guideline applies to all SA Health gastroenterology services and is to be utilised by all clinical, administrative and service management staff to guide appropriate and consistent waiting list management and patient prioritisation practices for the provision of planned colonoscopy procedures. Patients requiring an emergency colonoscopy (to be undertaken within 24 hours) are not assigned an urgency category or added to procedural waiting lists.

3. Principles

1. The provision of public colonoscopy services will be based on clinical need and equity of access.
2. Timely service delivery is a priority for all SA Health services and patients requiring a colonoscopy should receive it within the clinically recommended time.
3. SA Health services will aim for consistency of practice and will actively monitor and manage waiting lists to ensure effective demand management and appropriate prioritisation practices.
4. The clinical treatment of patients remains the responsibility of their treating clinicians.

4. Colonoscopy for adult patients

Section 4 of the policy guideline relates to the provision of colonoscopy to adults through the public health system. These procedures are usually provided by the gastroenterology services of adult (non-paediatric) public hospitals, with some hospitals also offering specialist surveillance programs for patients with specific conditions or risk factors.

4.1. Usual urgency categorisation

'Usual urgency categories' have been defined in order to promote equity of access to public colonoscopy services and to encourage consistency in the prioritisation and treatment of patients with similar symptoms or risk factors. The urgency category for a patient is to be allocated by an experienced public hospital clinician based on the patient’s clinical need.

The measurement of patient waiting time for a colonoscopy commences from the time a public hospital clinician determines that a procedure is required and adds the patient to the procedural waiting list, and concludes at the time that the patient receives the required procedure. The tool for measuring colonoscopy procedure waiting times is the Booking List Information System (BLIS). For BLIS purposes, the patient’s treating public hospital clinician is referred to as the authorised medical practitioner or delegate.

4.1.1 Diagnostic colonoscopy for symptoms

It is recommended that all adult patients with suspicious large bowel symptoms or rectal bleeding should be investigated, especially if other risk factors (such as older age or family history) are present. Alarm symptoms have been identified to include:

- weight loss
- severe pain
- anaemia
- palpable mass.

Table 1 outlines the recommended usual urgency categories for adult patients requiring a colonoscopy through the public health system.
The process for urgency categorisation of surveillance patients is as follows:

Due and is not specified as ‘ready for care’ earlier than appropriate. A summary of the procedure at the next available opportunity.

Future (for example 6 months, 12 months, 3 years or 5 years), a specific urgency Categories indicates that the patient is

For surveillance patients who require a colonoscopy at a set interval at some time in the future, and

Table 1: Usual urgency categories for adults requiring diagnostic or surveillance colonoscopy

<th>Recommended Urgency Category*</th>
<th>Symptoms / Surveillance</th>
</tr>
</thead>
</table>
| 1 (within 30 days)           | • Faecal Rapid Test (FRT) positive result, National Bowel Cancer Screening Program  
                              • Clinically significant rectal bleeding  
                              • Clinically significant iron deficiency anaemia  
                              • Change in bowel habit with alarm symptoms  
                              • Active or suspected inflammatory bowel disease (IBD) or diarrhoea where endoscopy is indicated to progress management  
                              • Abnormal imaging where cancer is suspected |
| 2 (within 90 days)            | • Change in bowel habit without alarm symptoms  
                              • Persistent/chronic diarrhoea  
                              • Port diverticulitis  
                              • Staged Surveillance Patient for whom a surveillance procedure is due within the next 90 days. This includes:  
                                o Patients requiring initial surveillance following removal of certain adenomas or in certain circumstances post curative resection for obstructive colorectal cancer (CRC).  
                                o Patients requiring surveillance related to family history or previous adenoma, curative resection for CRC or dysplasia in inflammatory bowel disease.  
                                Refer to section 4.1.1 for details of the urgency categorisation process for Staged Surveillance Patients. |
| 3 (within 12 months)          | • Colonoscopy required within 365 days |
| 4 (not ready for care)       | • Staged Surveillance Patient for whom surveillance is planned at a set interval at some time in the future. Refer to section 4.1.2 for details of the urgency categorisation process, and section 4.2 for advice on determining appropriate surveillance timing.  
                              • Deferred Patient that requires a colonoscopy within the next 12 months but for whom the procedure has been deferred, either for clinical reasons (patient is temporarily unfit for procedure) or personal reasons.  
                              NOTE: A patient cannot be assigned as ‘ready for care’ on the BLIS more than 12 months in advance. |

* Generally, malignancy will be considered to require treatment within 30 days.

4.1.2 Urgency categorisation – Surveillance Patients

Through the BLIS, patients that are ‘ready for care’ for a procedure required within the next 12 months are assigned as Category 1, 2 or 3. The assignment of one of these three Categories indicates that the patient is ready and available to be booked to undergo the procedure at the next available opportunity.

For surveillance patients who require a colonoscopy at a set interval at some time in the future (for example 6 months, 12 months, 3 years or 5 years), a specific urgency categorisation process is required to ensure that the patient is booked when the procedure is due and is not specified as ‘ready for care’ earlier than appropriate. A summary of the process for urgency categorisation of surveillance patients is as follows:

- Public hospital treating clinician (authorised medical practitioner or delegate) determines surveillance is required at a set interval at some time in the future, and
completes a booking form specifying the *date the procedure is due*, relevant BLIS surveillance Indicator Procedure Code, and assigning the patient as Category 2.

- **Patient is added to the BLIS** as Category 2, and then manually changed to Category 4 surveillance patient where they remain as ‘not ready for care’ until one month before the procedure due date. At this time, the patient reverts to Category 2 ‘ready for care’.

### 4.2 Surveillance timing

The following sections of the guideline set out recommended timing for surveillance colonoscopies for adults, where there is a family history of colorectal cancer (CRC), post adenoma, post curative resection for CRC, and for surveillance and management of dysplasia in inflammatory bowel disease.

#### 4.2.1 Colonoscopy related to family history

**Table 2: Risk ranking related to family history and surveillance timing**

<table>
<thead>
<tr>
<th>Patient Risk Level</th>
<th>Risk Factors</th>
<th>Surveillance Timing</th>
</tr>
</thead>
</table>
| Slightly above average risk | - 1 first degree or second degree relative diagnosed with CRC at age 55 or older  
- 2 relatives diagnosed with CRC aged 55 or older but on different sides of the family | Screening should be as for the average-risk population. FRT should be conducted every 2 years from 50 years of age. |
| Moderately increased risk | - 1 first degree relative diagnosed with CRC before age 55 (without potentially high risk features outlined below)  
- 2 first degree, or 1 first degree and 1 second degree relatives on the same side of the family diagnosed with CRC at any age (without potentially high risk features outlined below) | Colonoscopy to be done every 5 years starting at age 50, or at an age 10 years younger than first diagnosis of CRC in the family, whichever comes first |
| High risk | - 3 or more first degree relatives or a combination of first and second degree relatives on the same side of the family diagnosed with CRC at any age  
- 2 or more first or second degree relatives on the same side of the family diagnosed with CRC, plus any of the following high risk features:  
  - Multiple CRCs in a family member  
  - CRC before the age of 50  
  - Family member who has/had a Hereditary non-polyposis colorectal cancer (HNPCC) or a related cancer (endometrial, ovarian, stomach, small bowel, renal pelvis or ureter, biliary tract, brain cancer)  
- At least 1 first degree or second degree relative with a large number of adenomas throughout the large bowel (suspected FAP)  
- Member of family in which a gene mutation that confers a high risk of CRC has been identified | The high risk adult population is small in size. Adults assessed as being high risk require close management and development of a treatment plan specific to their clinical needs. Patients should be referred for medical review prior to colonoscopy. |

### Post Adenoma

Table 3: Surveillance timing for adenoma follow-up

<table>
<thead>
<tr>
<th>Finding at colonoscopy</th>
<th>Initial surveillance interval</th>
<th>Subsequent interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 or 2 small tubular adenomas (&lt; 10 mm)</td>
<td>5 years</td>
<td>If surveillance colonoscopy is normal, patient considered at average risk for metachronous disease. FRT every one to two years.</td>
</tr>
</tbody>
</table>
| High risk adenomas –  
  - 3 or more lesions  
  - ≥ 10 mm  
  - With tubulovillous or villous histology  
  - High grade dysplasia | 3 years | A (Refer notes below) |
| Large and sessile adenomas removed piecemeal and/or by endoscopic mucosal resection (EMR) | 3 to 6 months, and again at 12 months | If removal is complete, subsequent surveillance should then be based on histological findings, size and number of adenomas as set out above. |
| 5 or more adenomas | 12 months | A 
  B |
| 5 or more adenomas, where polyposis syndrome accounts for findings | Within 12 months | A 
  B |
| 10 or more adenomas | Within 12 months | AB |
| Family history – should be considered separately when planning colonoscopy surveillance | Intervals should be predominantly determined by the adenoma characteristics, unless a syndromic risk mandates more frequent surveillance. | B |

*A*: if advanced adenomas are found during subsequent surveillance, maintaining a three yearly surveillance schedule is prudent, but the choice should be individualised. The interval can be lengthened if advanced adenomas are not found.  
*B*: consider referring for genetic testing

5. Colonoscopy for children

Section 5 of the Policy Guideline relates to the provision of colonoscopies to children through the public health system. These procedures are almost exclusively provided by the Gastroenterology Unit at the Women’s and Children’s Hospital which provides a state-wide specialist paediatric service for children and adolescents. Colonoscopies for children and adolescents account for a small proportion of the total procedures undertaken through the total public health system, however there is an increasing demand for the procedure, highlighting the need to ensure the appropriate urgency categorisation based on clinical need to promote equity of access and the appropriate prioritisation of patients awaiting a procedure.

5.1 Urgency categorisation of children

The use of colonoscopy for both diagnostic and surveillance purposes is highly individualised and almost all procedures are undertaken with a general anaesthetic. For these reasons, detailed ‘usual’ urgency categories and surveillance timing intervals have not been specified. The determination of appropriate timing and indications for colonoscopy to children will be individually determined for each patient by the treating paediatric gastroenterologist. The information outlined below provides general guiding information only to assist clinicians in determining the appropriate treatment plan and urgency categorisation for children.

The urgency category for children requiring a colonoscopy is to be allocated by an experienced public hospital clinician (authorised medical practitioner or delegate) based on the patient’s clinical need.

Table 8 sets out the urgency categories for children requiring a diagnostic or surveillance colonoscopy through the public health system.

5.1.1 Diagnostic colonoscopy for symptoms

Diagnostic colonoscopy is indicated for children when investigating for: suspected inflammatory bowel disease; iron deficiency anaemia with GI blood loss; and overt bleeding from the bowel thought to be of colonic origin.

Where malignancy is suspected, this will generally require investigation and treatment within 30 days.

5.1.2 Colonoscopy for surveillance

Colonoscopy is used as a surveillance tool for children with long term inflammatory bowel disease and for children over the age of 10 years with familial adenomatous polyposis to monitor for dysplasia.

The appropriate surveillance timing for each child should be determined on an individual basis taking into consideration the child’s clinical condition and being mindful of the need to administer a general anaesthetic to undertake the procedure. The most common surveillance interval for children requiring a colonoscopy is 12 months, however it may be more appropriate to conduct surveillance at two yearly intervals.
Table 8: Urgency categorisation for children requiring diagnostic or surveillance colonoscopy

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category 1:</td>
<td>Colonoscopy required within 30 days</td>
</tr>
<tr>
<td>Category 2:</td>
<td>Colonoscopy required within 90 days, including Staged Surveillance Patients for whom a planned procedure is due within 90 days. Refer to section 5.1.3 for details of the urgency categorisation process for Staged Surveillance Patients.</td>
</tr>
<tr>
<td>Category 3:</td>
<td>Colonoscopy required within 365 days</td>
</tr>
<tr>
<td>Category 4:</td>
<td>Staged Surveillance Patient for whom surveillance is planned at a set interval at some time in the future. Refer to section 5.1.3 for details of the urgency categorisation process, and section 5.1.2 for information on surveillance colonoscopies for children. Deferred Patient that requires a colonoscopy within the next 12 months but for whom the procedure has been deferred, either for clinical reasons (patient is temporarily unfit for procedure) or personal reasons. NOTE: A patient cannot be assigned as ‘ready for care’ on the BLIS more than 12 months in advance.</td>
</tr>
</tbody>
</table>

5.1.3 Urgency categorisation – Staged Surveillance Patients greater than 12 months

Through the BLIS, patients that are ‘ready for care’ for a procedure required within the next 12 months are assigned as Category 1, 2 or 3. The assignment of one of these three Categories indicates that the patient is ready and available to be booked to undergo the procedure at the next available opportunity.

For surveillance patients who require a colonoscopy at a set interval at some time in the future (for example 6 months, 12 months, 3 years or 5 years), a specific urgency categorisation process is required to ensure that the patient is booked when the procedure is due and is not specified as ‘ready for care’ earlier than appropriate. A summary of the process for urgency categorisation of surveillance patients is as follows:

- **Public hospital treating clinician (authorised medical practitioner or delegate)** determines surveillance is required at a set interval at some time in the future, and completes a booking form specifying the date the procedure is due, relevant BLIS surveillance Indicator Procedure Code, and assigning the patient as Category 2.
- **Patient is added to the BLIS** as Category 2, and then manually changed to Category 4 surveillance patient where they remain as ‘not ready for care’ until one month before the procedure due date. At this time, the patient reverts to Category 2 ‘ready for care’.

6. Roles and Responsibilities

Chief Executive Officers, Local Health Networks are responsible for ensuring that all staff involved in the provision of colonoscopy services are informed about the guideline.

Health Service Divisional Directors are responsible for promoting service provision in accordance with the guideline.

Clinicians are responsible for ensuring they are familiar with the guideline and the specified usual urgency categories and surveillance timing.
Administrative staff that add patients to the Booking List Information System (BLIS) are responsible for ensuring that diagnostic and surveillance patients are added to the correct clinical urgency category assigned by the treating clinician, and that surveillance patients greater than 12 months are managed in line with the provisions of this guideline.

13. Evaluation

The policy guideline will be evaluated and reviewed every two years to ensure it remains reflective of best practice and nationally endorsed clinical guideline. Review and amendment may occur more frequently if new information becomes available.

14. Definitions

**Authorised medical practitioner** is the public hospital medical practitioner with overall responsibility/accountability for the care of a patient on a public hospital waiting list. Within Local Health Networks the authorised medical practitioner may hold the role of Divisional Director, Divisional Chief, Clinical Director or Head of Unit or is the medical practitioner who will perform the procedure.

The medical practitioner must be registered by the Medical Board of South Australia and be employed by a Local Health Network. These practitioners include senior consultant, consultant, senior visiting medical specialist/officer, visiting medical specialist/officer, and clinical academic. An authorised medical practitioner may delegate the task of clinical urgency categorisation to a nominated clinician where clearly defined categorisation protocols have been documented by Local Health Network.

**Category 1 Patient** is a patient for whom it has been determined, by their treating public hospital clinician, that a colonoscopy is required urgently and within the next 30 days. For adult patients, they fit the ‘symptoms/surveillance’ criteria outlined in the Category 1 section of Table 1: *Usual urgency categories for diagnostic and surveillance colonoscopy* within this guideline.

**Category 2 Patient** is a patient for whom it has been determined, by their treating public hospital clinician, that a colonoscopy is required semi-urgently and within the next 90 days. For adult patients, they fit the ‘symptoms/surveillance’ criteria outlined in the Category 2 section of Table 1: *Usual urgency categories for diagnostic and surveillance colonoscopy* within this guideline.

**Category 3 Patient** is a patient for whom it has been determined, by their treating public hospital clinician, that a colonoscopy is required non-urgently and within the next 365 days.

**Category 4 (not ready for care) Patient** is a patient who requires a colonoscopy but who is deferred.

**Deferred Patient** includes a surveillance patient who requires a colonoscopy at a specified date in the future, or a patient who requires a colonoscopy within the next 365 days but for whom the procedure has been deferred either for personal reasons (for example the patient is going on an overseas holiday) or for clinical reasons (for example the patient is temporarily unfit for the procedure).

**Diagnostic colonoscopy** is a colonoscopy undertaken for the purpose of diagnosing a patient’s symptoms.
**Ready for care patient** is a patient for whom it has been determined, by their treating clinician, that a colonoscopy is required at some time within the next 12 month period, and the patient is clinically ready and able to undergo the procedure. These patients fall into one of the following categories: Category 1, Category 2 or Category 3.

**Surveillance patient** is a patient for whom it has been determine, by their treating public hospital clinician, that a planned surveillance colonoscopy is required at some time in the future.

**Surveillance colonoscopy** is a colonoscopy undertaken on a patient without active/current symptoms who has had a previous colonoscopy and requires surveillance related either to abnormal past results or some other risk factor (for example a family history of CRC).
